

Figure 1. Model and representation

Figure 1. Model and representation. (1A) The latent world state: tile geometry, lane centrelines, the ego's true collision footprint, and the stop line the model measures "d_stop" against. (1B) The 15-entry privileged projection the policies consume. This is a privileged model state and not an observation: it is read from the latent world, not estimated from sensors. (1C) Of the 15 components, 6 are sensor-estimable, while 2 are the agent's own memory with no physical counterpart a sensor could estimate, which is why an observation model cannot be obtained by relabelling this vector. No belief representation exists in this formulation.
