

Figure 2. Policy structure and ambiguity

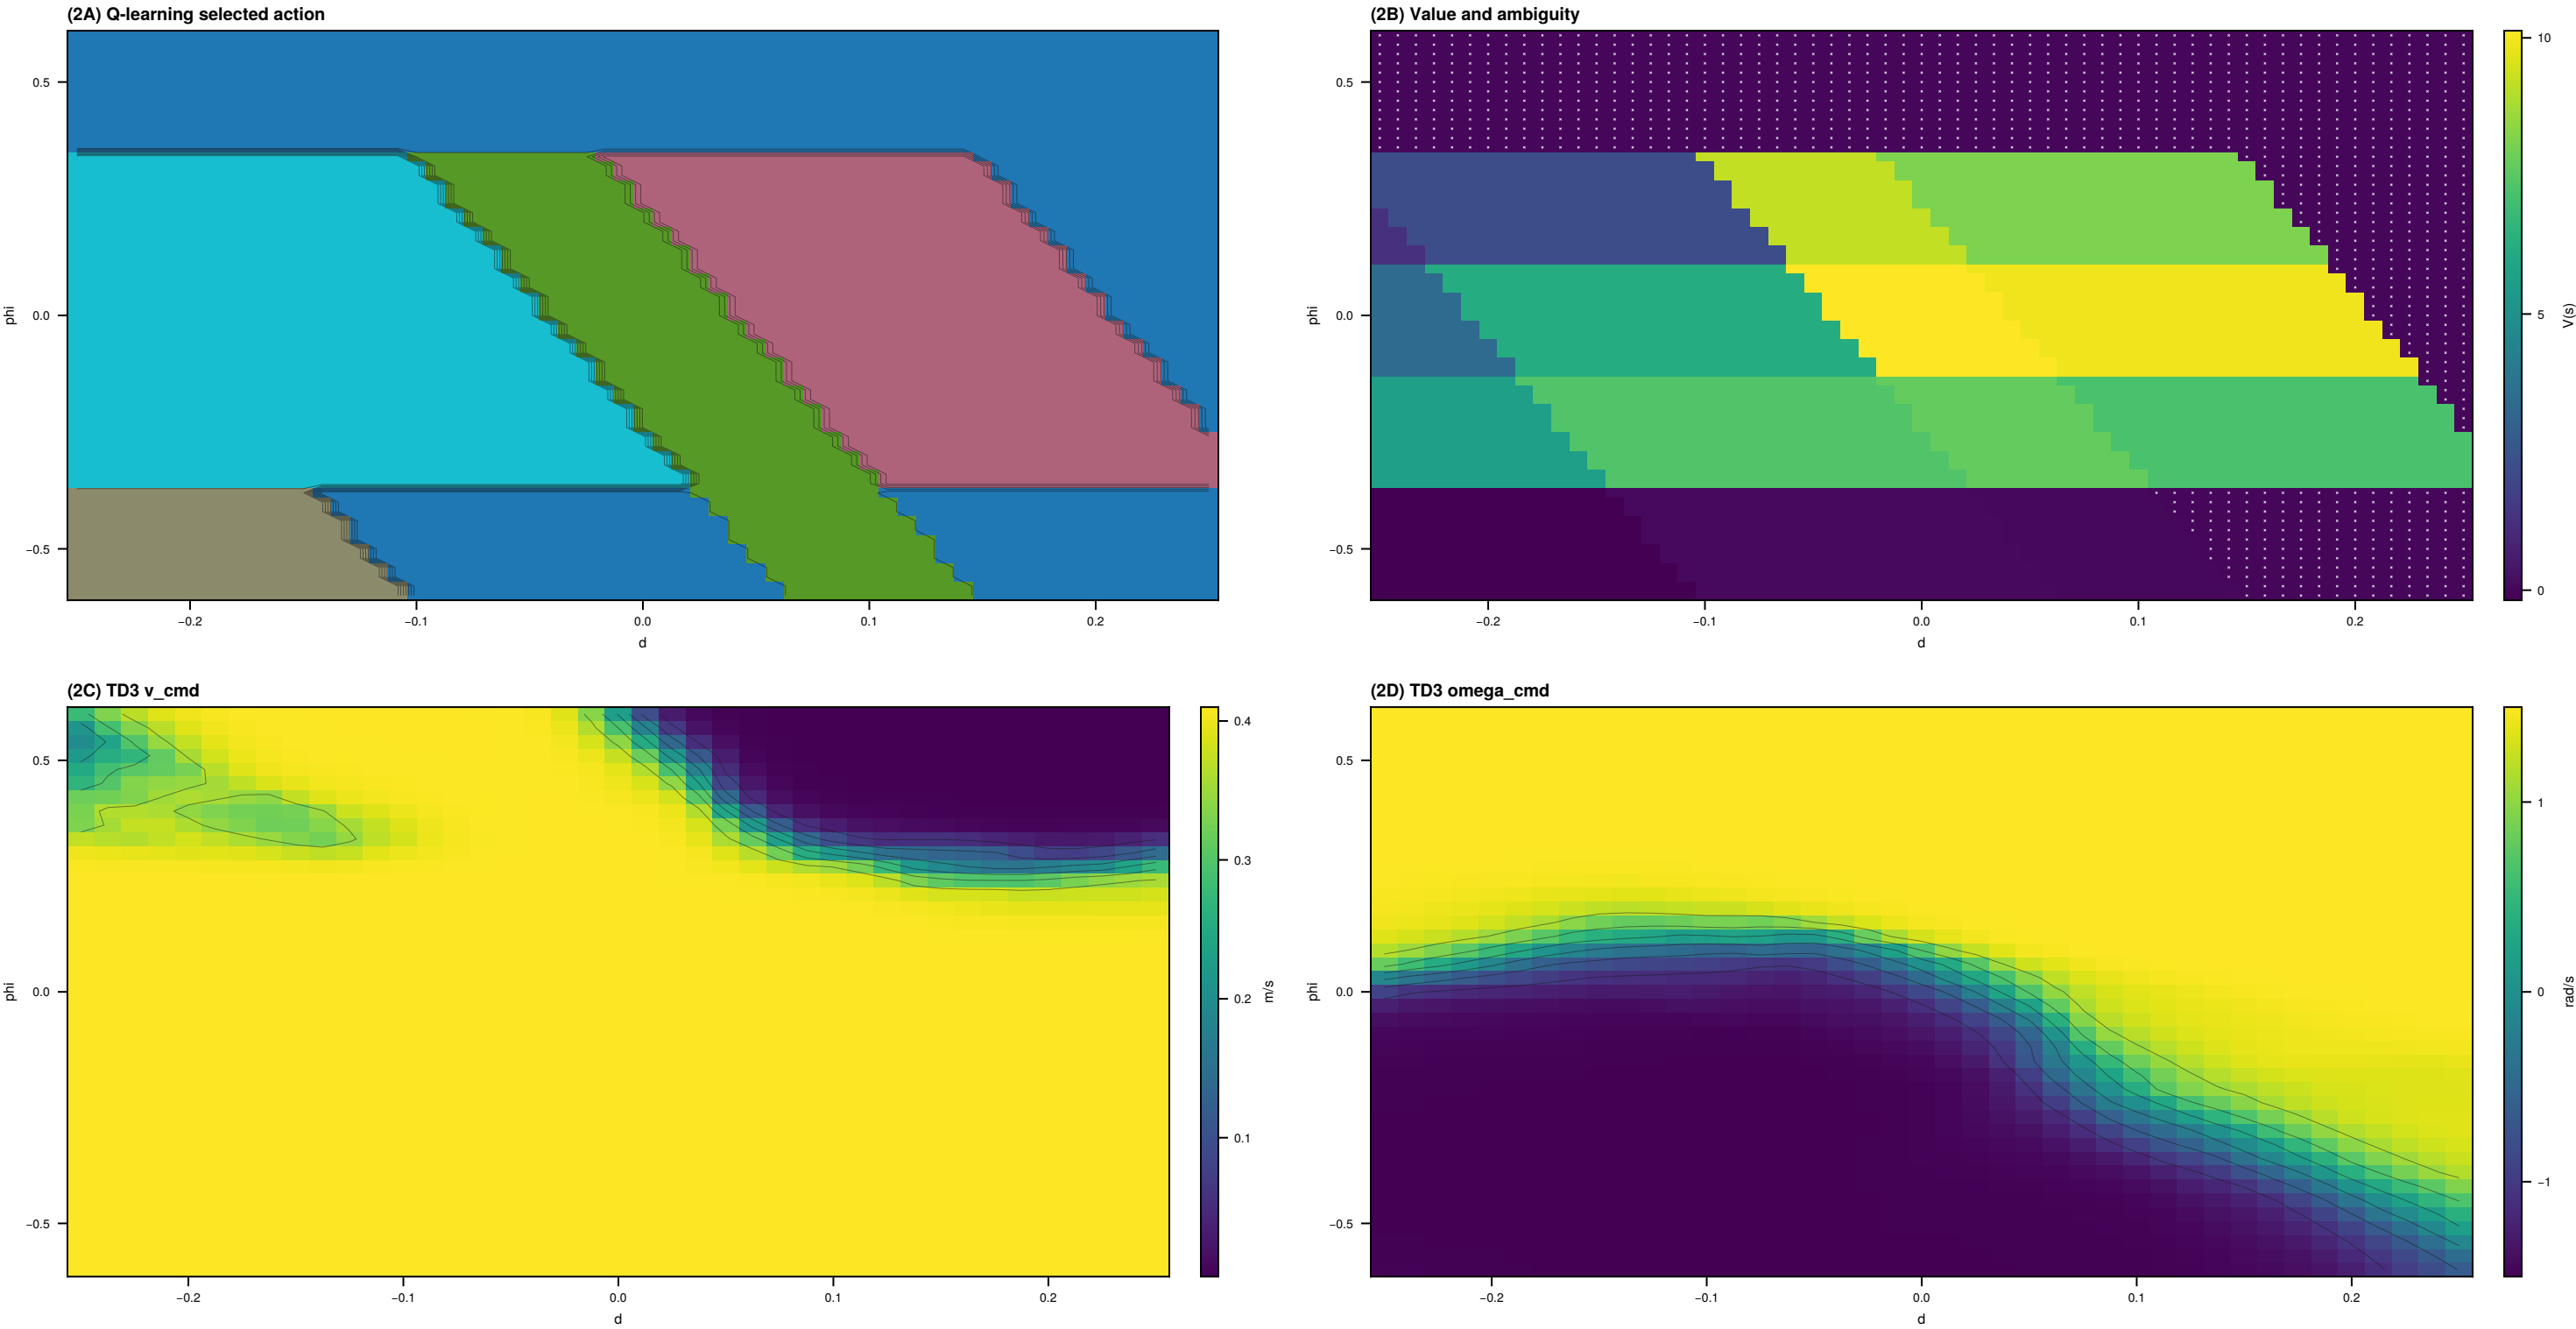

Figure 2. Policy structure and ambiguity. Slices over 'd' x 'phi' in feature space: every cell is a coordinate at which the policy can be evaluated, and is not guaranteed reachable by the dynamics. Fixed context: v = 0.1; tile = STRAIGHT; d_stop = none; sigma_stop = false; duck = NONE. (2A) The selected action. (2B) Value with the tie and margin surfaces: 1174 of 3721 cells are tied, against 2547 decisive ones, so a one-action-per-cell map overstates how decisive the table is. The discretizer indexes 'bin(d)' and 'bin(phi + d)', so these 3721 cells collapse to 23 distinct tabular states. (2C, 2D) TD3's continuous outputs, on separate panels because m/s and rad/s do not share an axis.
